Re: Mechanical Lippage Tuning System (MLTS)

Valued Customers and Interested Parties,

LAMINAM by Crossville® is pleased to recommend the Mechanical Lippage Tuning System for use with its thin porcelain tile products.

This tensioning system clearly helps reduce lippage between large thin porcelain tiles and bring about proper alignment of the thin tile pieces. Further the MLT system's design allows for the complete embedding of the MLTS base/foot by the surrounding mortar without creating voids beneath the edges of thin tile product.

By assuring void free supportive mortar coverage and lippage free alignment along the critical edges of the thin porcelain tile, the Mechanical Lippage Tuning System has become an essential tool in creating high quality thin porcelain tile installations for both floors and walls.

Please contact MLTS directly or Crossville Technical Services if there are any further questions related to the MLTS system or LAMINAM by Crossville® thin porcelain tile products.
